

Electrical Problems?

If you need to turn off the electricity, locate the fuse box/consumer unit and turn off the large, main OFF/ON switch

If certain electrical items are not working in the property, check the fuse box/consumer unit. Modern electrics are fitted with a circuit breaker so if a fault develops in the property, it will trip a switch and the circuit will break stopping any power.

Check all switches are at the ON position and if not, flick to ON position.

Do not overload household plug sockets as this will cause a trip or blown fuse.

Check to see if your neighbours are effected. If they are, call your electricity company.
